# Stromag TRI-R Highly-Flexible Ring Coupling

## Stromag TRI-R coupling concept

Stromag TRI-R couplings are highly-flexible rubber couplings with linear spring characteristic ideal for diesel engine and resiliently mounted drives.

The torque range of this series is 1150 to 63,000 Nm. With couplings up to 16,000 Nm, the outer connection dimensions conform as a standard to the flywheel connections of the SAE standard J620. The larger couplings are basically designed with metric flywheel connections.

Stromag TRI-R couplings combine a ring element of rubber-flexible material and a diaphragm of spring steel. The ring element is torsionally flexible and assures a radial flexibility.

The diaphragm assures the axial flexibility, so that the coupling allows offset in all directions.

Each Stromag TRI-R size comes with a range of elastomer qualities and torsional stiffnesses. These allow precise configurations for drives susceptible to torsional vibrations. The Stromag coupling TRI-R can also be supplied in multi-row combinations of ring elements.

## Type of application

Stromag TRI-R couplings are designed for use on piston engines. The ring element can be bolted directly to the flywheel of an engine. The connection of two shafts or two flanges is also possible when executed accordingly.

Due to its high axial and radial offset capacity, the coupling is ideal for applications with resiliently mounted drives. A good structure-borne noise insulation is achieved by the great rubber volume.

# Stromag TRI-R Highly-Flexible Ring Coupling

## Instruction for the designer

The metal parts of Stromag TRI-R coupling are made of steel. The ring element is made of different elastomer materials in various torsional stiffnesses.

The design with natural rubber (NR) can be used within the temperature range from – 50 °C up to +80 °C.

Damping work may cause the flexible element to reach temperatures higher than ambient. This must be considered when the coupling is to be fitted with a guard or cowl, and adequate ventilation and heat dissipation must be provided.

The Stromag TRI-R coupling can be delivered with EN 10204 acceptance as defined in the classification societies rules.

### Use in potentially explosive environments

The coupling conforms to the requirements under Directive 2014/34/EU and can be used as follows:

- a. Zone 1 (gas, Category 2G) in Groups IIA, IIB, and IIC, T4
- b. Zone 2 (gas, Category 3G) in Groups IIA, IIB, and IIC, T4
- c. Zone 22 (dust, Category 3D) for dusts with a minimum ignition energy > 3 mJ, T 125 °C

The Stromag TRI-R coupling compliance with the requirements for each of these zones / categories is documented in the form of the following codes on our products:

#### Use in gas atmospheres:

 II 2G c T4 or II 3G c T4

#### Use in dust atmospheres:

 II 3D c 125 °C

Use in potentially explosive environments must be based on the request form annexed to this catalogue.

## Classification rules

For survey of the coupling by a classification society, the regulations of the society have to be adhered to. The coupling characteristics may differ from the definitions given in this catalogue. Accordingly prepared data sheets are available on request.

Some classification societies prescribe fail-safe devices for marine main drives.

# Stromag TRI-R Highly-Flexible Ring Coupling

## Fail-safe device

Stromag TRI-R couplings are available with an fail-safe device. A rupture in the flexible element causes claws to intermesh, forming a torsionally rigid, backlash connection between the drive and output sides. Temporary emergency operation is possible with limited torque. The permissible torques and speeds must be calculated separately on the basis of torsional vibrations transferred via a torsionally rigid structure.

## Instructions on choosing the coupling size

The static and dynamic characteristics of Stromag TRI-R couplings are available. These can help to choose the suitable coupling size for the specific application. The key factors are the loads induced by the transferred power and torsional vibrations. Stationary operating modes must be based on  $T_{KN}$ ,  $T_{KW}$ , and  $P_{KV}$ , nonstationary operating modes on the  $T_{Kmax}$  values.

Stromag GmbH departments can provide support, specifically in calculating the torsional vibrations. We therefore ask you to complete and send us the question sheet annexed to this catalogue.

As a rule, flexible couplings are a safety feature in the form of a predetermined breaking point on a drive train. Hence, overloading a drive train generally leads to failure of the flexible coupling element. This behaviour is intentional and protects the entire system from unforeseen damage. Any consequential damage arising from this safety function of the coupling must be considered in advance by the system designer and monitored or eliminated with suitable measures.

# Stromag TRI-R Highly-Flexible Ring Coupling

## Installation instructions and scope of delivery

Stromag TRI-R coupling can be bolted directly to the flywheel of the engine through the ring element (3) and the connection flange (4). The counterside of the ring element (3) is bolted to the diaphragm (8) through the center ring (6).

The diaphragm (8) transmits the torque to a connected machine, a gearbox, or similar through the connection with the pressure ring (7) via the hub (1).

The ring element of size 12 is split into 2 halves in order to assure a simple radial mounting.

The delivery extent of the Stromag TRI-R coupling in standard execution comprises:

- 1 = Hub
- 3 = Ring element
- 4 = Connection flange
- 6 = Center ring
- 7 = Pressure ring
- 8 = Diaphragm
- 9, 10, 11, 15 = Screws
- 12 = Nut
- 14 = Washer

## Storing flexible rubber elements

When stored properly, flexible rubber elements retain their properties over several years. It is essential here that the stored parts are protected against oxygen, ozone, light, heat, moisture, and solvents. Solvents, fuels, lubricants, chemicals, acids, disinfectants, and similar may not be stored in the same room. The storage temperature should not be lower than +10°C and not higher than +25°C.

All UV light sources are harmful and must be avoided. Equipment that generates ozone, e.g. light sources and electric motors, must be kept away from the storage location. The relative air humidity should not exceed 65 %.

Further details can be taken from DIN 7716 und ISO 2230.

# Stromag TRI-R Highly-Flexible Ring Coupling

## Characteristics of the Stromag TRI-R coupling

<b><math>T_{KN}</math></b>	
The coupling's nominal torque can be permanently transferred over the whole permitted speed range. It must be higher than the system's nominal torque $T_N$ .	$T_{KN} \geq T_N$
<b><math>T_{Kmax1}</math></b>	
The coupling's max torque $T_{Kmax1}$ can be endured as a peak load and may not be exceeded by peak torques $T_{max1}$ when the system is operating in normal, nonstationary mode. A system's normal nonstationary modes are unavoidable and occur repeatedly (e.g. starting/stopping, resonance passes, switchovers, accelerations, etc.).	$T_{Kmax1} \geq T_{max1}$
<b><math>T_{Kmax2}</math></b>	
The coupling's max torque $T_{Kmax2}$ can be endured as a peak load and may not be exceeded by peak torques $T_{max2}$ when the system is operating in anomalous, nonstationary mode. A system's anomalous, nonstationary modes are avoidable and are not part of the planned operating scheme (e.g. emergency stops, sync failure, short circuits, etc.) Overloading the Stromag TRI-R coupling with peak torques $T_{max2}$ in a system's anomalous nonstationary mode shortens the service life and is tolerated in individual cases.	$T_{Kmax2} \geq T_{max2}$
<b><math>T_{Kw}</math></b>	
The admissible permanent alternating torque describes the amplitude of the max permanent periodic torque variation. This torque may be superimposed on a base load equal to $T_{KN}$ . This requires in addition an analysis of the max damping power $P_{KV}$ .	
<b><math>\Delta K_a</math></b>	
Max axial displacement of the coupling. The shaft's axial displacement $\Delta W_a$ must be less than $\Delta K_a$ .	$\Delta K_a \geq \Delta W_a$
<b><math>\Delta K_r</math></b>	
Max radial displacement of the coupling. The shaft's radial displacement $\Delta W_r$ must be less than $\Delta K_r$ .	$\Delta K_r \geq \Delta W_r$
The values of $\Delta K_r$ for the Stromag TRI-R coupling refer to coupling shaft speeds up to 600 rpm. The conversion to other speeds is made by the equation	$\Delta K_r(n) = \sqrt{\frac{600 \text{ min}^{-1}}{n}} \cdot \Delta K_r$
With ambient temperatures higher than 30°C, the admissible radial offset must be reduced by the temperature factor $S_{\theta Kr}$ .	$\Delta K_r(T_U) = \frac{\Delta K_r}{S_{\theta Kr}}$
<b><math>\Delta K_w</math></b>	
Max angular displacement of the coupling. The shaft's angular displacement $\Delta W_w$ must be less than $\Delta K_w$ . A $\Delta K_w$ value of 0.5° is permitted for TRI-R couplings. This value, however, may be utilised to the full only when there are no other options for shaft displacement.	$\Delta K_w \geq \Delta W_w$

# Stromag TRI-R Highly-Flexible Ring Coupling

## Characteristics of the Stromag TRI-R coupling

<b>F<sub>a</sub></b>	
The axial reaction force of the diaphragm is stated for an offset of 1 mm. Steel diaphragms have a progressive characteristic. Formulas for the calculation of larger axial offsets on request.	
<b>C<sub>r</sub></b>	
The radial stiffness represents the ratio of radial reaction force to radial displacement. The specified values apply to the coupling at operating temperature, with a surface temperature of about 30°C.	
<b>C<sub>Tdyn</sub></b>	
<p>The dynamic torsional spring stiffness represents the ratio of torque amplitude to torque angle during an oscillation.</p> <p>The torque amplitude is superimposed on an initial load (coupling torque). Stromag TRI-R coupling's C<sub>Tdyn</sub> value remains constant over the coupling torque (linear characteristic curve), but changes with the amplitude, frequency, and temperature of the flexible element.</p> <p>The specified nominal values for C<sub>Tdyn</sub> are based on a coupling torque of 0.8 • T<sub>KN</sub>, an alternating torque of 0.2 • T<sub>KN</sub>, and a frequency of 10 Hz on a coupling at operating temperature, with a surface temperature of about 30°C.</p>	$C_{Tdyn} = \frac{T_{el}}{\varphi_w}$
<b>C<sub>Tdyn warm</sub></b> takes into account that high power dissipation causes the coupling to heat up.	$C_{Tdyn\ warm} = 0,7 \cdot C_{Tdyn}$
<b>C<sub>Tdyn A</sub></b> takes into account the effects of a small alternating torque amplitude.	$C_{Tdyn\ A} = 1,35 \cdot C_{Tdyn}$
Calculations of torsional vibrations in the system are recommended to include C <sub>Tdyn warm</sub> (0,7), und C <sub>Tdyn A</sub> (1,35)	

<b>Ψ</b>	
<p>The relative damping is a factor for the capacity of a coupling to convert a part of the occurring cyclic energy into heat.</p> <p>The damping can be determined by the damping loop (hysteresis loop).</p> <p>The area A<sub>D</sub> is a factor for the damping work W<sub>D</sub> during a vibration cycle.</p> <p>The area A<sub>el</sub> represents the work done in deflection W<sub>el</sub> at a given load.</p> <p>The specified nominal values for Ψ are based on a coupling torque of 0.8 • T<sub>KN</sub>, an alternating torque of 0.2 • T<sub>KN</sub>, and a frequency of 10 Hz on a coupling at operating temperature, with a surface temperature of about 30°C.</p>	$\Psi = \frac{W_D}{W_{el}} = \frac{A_D}{A_{el}}$

# Stromag TRI-R Highly-Flexible Ring Coupling

## Characteristics of the Stromag TRI-R coupling

### $P_{kv}$

The admissible damping power indicates how much damping (heat) the coupling can permanently absorb resp. dissipate. The sum of the damping power of each vibration order (i.e.  $\Sigma P_{vi}$ ) must be less than the damping power of the coupling.

$$P_{vi} = \frac{\pi}{\sqrt{\left(\frac{2\pi}{\Psi}\right)^2 + 1}} \cdot \frac{T_{wi}^2 \cdot f_i}{C_{tdyn}}$$

$$P_{kv} \geq \Sigma P_{vi}$$

The stated value  $P_{kv60}$  describes the damping power which can be absorbed over the period of 1 hour. To determine the damping power which can be permanently absorbed ( $P_{kv\infty}$ ), the value  $P_{kv60}$  has to be multiplied by the factor 0.5. With an ambient temperature  $T_U$  higher than 30°C, the admissible damping power must be reduced by the temperature factor  $S_{9PKV}$ .

$$P_{kv}(T_U) = \frac{P_{kv}}{S_{9PKV}}$$

### Temperature factors $S_{Kr}$ und $S_{9PKV}$

Temperature factors shall take into consideration the reduction of the physical characteristics of rubber-flexible material caused by heating.

The coupling temperature is determined by the ambient temperature plus an internal heating caused by internal material friction in the rubber volume, resulting from alternating torques and alternating loads due to shaft offsets.

With higher ambient temperatures the coupling characteristic values  $\Delta_{Kr}$  and  $P_{kv}$  must be reduced through the corresponding temperature factors  $S_{9Kr}$  and  $S_{9PKV}$ .

		<input type="radio"/>	T3
		<input type="radio"/>	T4
Max surface temperature	dust	<input type="radio"/>	125°C
		<input type="radio"/>	< 120°C
		<input type="radio"/>	-20°C to +40°C
Ambient temperature		<input type="radio"/>	other ambient temperatures only with certain restrictions

# Stromag TRI-R Highly-Flexible Ring Coupling

## Special designs

### TEF..W – RR / MWU

2 in 1 combination with an electric pole-face friction clutch to connect two machines from shaft to shaft.

DD-\_886282

### TEF..W – RRDP

For mounting to a propeller shaft of a marine drive, additionally to absorb axial thrust.

DD-\_886281

### TEF..W – 3R

To connect a flywheel or equivalent to a shaft.  
Low torsional stiffness due to 3 ring elements in series.

DD-\_886280
